

No gaps left when installing photovoltaic panels

How much gap should be between solar panels?

The gap between the last row of solar panels and the roof's edge should be a minimum of 12 inches or one foot. This ensures the panels are accommodated as they expand and contract during the day. See also: [Mounting Solar Panels: A Complete Beginner's Guide to Installation](#) [How Much Gap Should Be Between Two Solar Panels?](#)

Why do solar panels underperform?

Industry data shows 30% of residential solar projects underperform by 10-20% because of poor spacing choices. For example, a California installation with 1-meter row gaps (instead of the recommended 1.8 meters) lost 12% annual energy yield--equivalent to \$800 extra in electricity bills yearly--due to winter shading.

How much space should be between two solar panels?

It is best to leave four to seven inches of space between two solar panels. Again, this accommodates the solar panels' expansion and contraction during the day. [How Much Gap Should Be Between Solar Panel Rows?](#)

Can solar panels touch each other?

Studies in Australia and other countries have proven that when flexible solar panels are placed next to one another, with one set having an air gap and another not having a gap, the efficiency is only reduced by about 9% for the panels with no gap at all.

[Why Are the Gaps Between Solar Panels Necessary?](#) Solar panel frames are constantly contracting and expanding, so the panels could possibly touch each other and cause damage if they ...
