

Solar power generation installed in the past decade

Cumulative installed solar capacity, measured in gigawatts (GW).

Small-scale solar produced an estimated 73,619 GWh or about 31% of all solar generation in 2023 -- compared to 164,502 GWh generated by utility-scale installations.

In the past decade, solar has ballooned from a fraction of a percent of both capacity and generation to become the second largest renewable in both categories. At the end of June 2014, ...

The past decade has shown a rise in renewable energy from an alternative source to an increasingly important feature in the United States energy mix. Environment America showed in its ...

"Solar panels, wind turbines, electric vehicles and battery storage are benefiting people in all 50 states, providing the building blocks of a clean energy system free from dirty fossil fuels."

DOE research and development efforts have accelerated solar industry progress by an estimated 12 years. This timeline features the key innovations that have advanced the solar industry in the United ...

Over the last ten years, solar grew from niche technology to a dominant source of new energy that fuels our economy. The 2010s have come to a close, and what a decade it was for solar ...

In 2024, net solar power generation in the United States reached its highest point yet at 218.5 terawatt hours of solar thermal and photovoltaic (PV) power. Solar power generation has...

The graph above shows all new types of installed electricity over the past decade, including solar, wind, natural gas, and other. Solar is represented in yellow.

This report uses data from the EIA to analyze solar and wind capacity and generation over the past decade (2014 to 2023) in all 50 states and the District of Columbia.
