What is solar energy & how does it work?

Solar energy refers to the sun's radiant light and heat that solar panels harness to generate electricity. Unlike traditional fossil fuels such as coal, oil, and natural gas that are finite and pollute the environment, solar energy is abundant and emits zero greenhouse gases. As such, it's an eco-friendly and renewable energy source.

How do solar panels generate electricity?

This process is constant. Over 500 million tons of hydrogen atoms are converted into helium every second, resulting in photons that generate solar energy here on Earth. In a nutshell, solar panels generate electricity when photons (those particles of sunlight we discussed before) hit solar cells. The process is called the photovoltaic effect.

How do solar panels work?

The PV cell comprises layers of semiconductor materials -- 90 to 95% of solar panels use silicon as their semiconductor -- specially treated to create an electric field. As mentioned earlier, when sunlight hits the cell, the photons in the light excite the electrons in the semiconductor material, causing them to move and generate an electric current.

Are solar panels energy efficient?

No solar panel is 100% efficient. Much of the sunlight that strikes a panel is either reflected, not absorbed, or contains photons whose energy is too low to free electrons. Some photons have too much energy, and the excess is wasted as heat.

It sounds like magic: Capturing energy from the sun and converting it into electricity to run your toaster. It's science, not magic, though. Solar panels use a curious bit of science called the ...
