

# Will photovoltaic panels be damaged if they are not exposed to sunlight

It will not degrade by any measurable amount if it is stored away from sunlight.

Solar panels don't "turn off" just because you're not using them. Even when disconnected from the grid or battery system, they're still exposed to sunlight and weather--factors that can impact ...

Discover why solar panels don't get damaged under sunlight even without a connected load. Learn how the photovoltaic effect works inside every panel.

Like everyone said, that's not a problem at all. Physically in a very simplified sense, what's happening on a molecular level is that when photons hit the silicone, it excites electrons to jump into higher energy ...

Unconnected PV modules still generate electricity when exposed to sunlight, but without a connection to the grid or a battery system, this energy dissipates unused.

I would be more worried about the connectors of your panels when not in use accidentally coming in contact with something connecting a circuit and causing damage or a fire.

Once a solar panel is left out in the sun for too long without a load, it can get damaged. There's nowhere for the power to flow and, without a regulator, the current can overload the system.

It is true that some CdTe (cadmium-telluride) panels can be damaged if left without a load in the sun. As a practical matter, it is not an issue for your silicon based panels.

When a solar panel is not connected, but still it is exposed to solar radiation, it will continue to produce electricity. This extra electricity can lead to overheating and cause the voltage ...

When a solar panel is first exposed to sunlight, a phenomenon called "power stabilisation" occurs due to traces of oxygen in the silicon wafer. This effect has been well studied and is the initial stabilisation ...
